RELEASE NOTES: **TELCOWARE 2.9.2**

CONTENTS

- Auto Provisioning in PBXware 3.8.2
- New in this Release
- Resolved Issues

AUTO PROVISIONING in 3.8.2

In the latest PBXware 3.8.2 patch Bicom Systems introduced an improved Auto Provisioning System which would have multiple benefits for our users in terms of speed, security and increased functionality. Now our customers will be able to use both TFTP and HTTP provisioning simultaneously, as long as devices support HTTP provisioning with digest authentication,

- **Increased Security**
Files are not stored on tftp anymore but instead are created dynamically and served to the device after a configuration request is sent to PBXware. HTTP provisioning requires a username and password, providing an additional layer of security.
- **Increased Speed**
Devices will be able to use HTTP protocol for much faster provisioning.
- **Increased Functionality** -
 - UAD templating per tenant, per device
 - Polycom - Support for multiple firmware versions added
 - Yealink - Support for older and v.70 firmware version added (not simultaneously).
 - Support for Yealink T4x devices added.
 - Cisco - additional UADs added

RELEASE NOTES: **PBXWARE 3.8.2**
